EDUCATION

South China University of Technology Sep 2017 - Jul 2021
Software Engineering Bachelor Software Academy Guangzhou
Lingnan University Sep 2025 - Jul 2026
Artificial intelligence Master Hong Kong

SUMMARY

- Rich software development and blockchain project experience, covering back-end, big data, smart contract full-link development.
- Proficient in Java, Rust, Python, Solidity, Move, familiar with blockchain platforms (Ethereum, Sui, Solana).
- Have big data processing and distributed system development capabilities, and be familiar with Kafka, Flink, ElasticSearch, Redis, MySQL, and S3.
- Chinese and English communication fluency, IELTS 6.5.

SKILLS LIST

Programming Language: Rust, Java, Python, Solidity, Move
Development Framework: Spring Boot, Foundry, Anchor, Flask, Node.js
Database and Big Data: MySQL, PostgreSQL, Kafka, Flink, ElasticSearch, ClickHouse, Druid, Redis
Block Chain: Ethereum, Solana, Sui

Language skills

- **Languages:** English: IELTS(6.5)

PROFESSIONAL EXPERIENCE

Chinese Academy of Engineering Large Model Supervision Insurance Hoop Model Project Team Mar 2025 - Oct 2025
Researcher Guangzhou

- Use Langgraph to build a large-scale multi-Agent experimental platform to support 100-level AI model interaction.
- Based on the Express development of back-end services and request agent layer, to achieve high concurrent task scheduling and cross-platform API management.
- Using the Foundry framework and Move / Solidity to write smart contracts, in the Ethernet Square and Sui chain to achieve Agent identity management, call track certificate and security audit.
- Build blockchain AI traceability mechanism, realize the model call the whole process of traceability and auditable, improve traceability efficiency from O(n) to O(1).
- Technology stack: Python, Langgraph, TypeScript, Express, Foundry, Solidity, Move

Bit Universe Aug 2024 - Mar 2025
Smart contract development Remote

- Lead the design and optimization of ERC404 smart contracts, reduce transaction Gas consumption by 50% and improve chain interaction performance.
- Develop an on-chain pledge income calculation algorithm to achieve efficient distribution logic and improve throughput and stability.
- Responsible for Ethereum and Solana cross-chain contract design and implementation, supporting multi-chain NFT asset interaction.
- Technology stack: Solidity, Rust, Hardhat, Foundry, PostgreSQL, Redis

Semitronix Jan 2023 - Aug 2023
Java engineers Changsha

- Independent development of wafer yield detection applications, defect image processing and visualization, detection efficiency increased by 90%.
- Application of KNN, interpolation, convolution algorithm for defect identification, significantly reduce manual screening costs.

- Based on Spring Boot + MySQL to build back-end services, and combined with S3 object storage, support massive detection data access and management.
- Technology stack: Java, Spring Boot, MySQL, Redis, S3

Huawei Jul 2021 - Jan 2023

Java engineers Shenzhen

- Based on Kafka + Flink, build a real-time data stream processing pipeline, shorten the log preprocessing time from 5 minutes to 30 seconds, and support millions of concurrency.
- Design and optimize the MyBatis + MySQL + ElasticSearch query scheme, fault detection system retrieval performance improved by 60%.
- Use S3 for large-scale log storage and archiving to improve data scalability and query flexibility.
- Cross-departmental collaboration integrates multi-source logs to build a big data analysis platform to improve O & M and fault location efficiency.
- Technology stack: Java, Spring Boot, Kafka, Flink, MySQL, ElasticSearch, ClickHouse, Druid, S3

PROJECT EXPERIENCE

Agentic AI risk traceability audit system Mar 2025 - Oct 2025

Head of Development

- Identity and authentication design: Based on the blockchain DID/VC identity system, design and implement the AI Agent and tool components of the chain identity registration and authentication process.
- Interaction traceability and trajectory construction: Use Sui Move /Solidity smart contracts to record each interaction event, dynamically generate interaction trajectory diagrams, and support node-level risk propagation analysis.
- Front-end system implementation: the front-end is based on Vue3 ECharts to realize visual cockpit, supporting multi-mode switching to display interactive trajectory and risk nodes; The back-end is based on TypeScript/Node.js call contract and GraphQL interface to realize efficient query and audit, dynamically generate interactive trajectory diagram, and support 100-level risk agent traceability and audit analysis.
- Multi-Agent experimental platform design: based on the Langgraph framework to build a large-scale multi-Agent simulation experimental platform, support task data acquisition, Agent self-organizing collaboration and workflow construction, used to verify the audit and traceability algorithm.

Semitronix wafer defect monitoring applications Jan 2023 - Aug 2023

Java development, image algorithm research and development

- Crystal image redrawing algorithm: design and optimize the crystal image redrawing algorithm, using Knn, interpolation and other image processing algorithms, according to the crystal data to redraw all levels of the crystal image, improve image processing speed.
- Database table structure design: design the database table structure, will draw the image stored in the picture server, and the address stored in the database.
- Background query interface optimization: use the SpringBoot framework to write and optimize the background query interface to achieve fast query function.

Huawei network equipment operation service Sep 2022 - Dec 2022

Big data development, background development

- OLAP database deployment and optimization: Understand and use ClickHouse and Druid for data storage and query optimization, design and implement efficient data partitioning strategies, and improve query performance.
- Stream processing system design and implementation: Using Kafka and Flink to build a real-time data stream processing pipeline to achieve low latency, high throughput data processing.
- Programming and development: mainly use Java for core module development, write efficient algorithms and data structures to optimize data processing speed and system response time.
- Cross-team collaboration: Work closely with data science teams and business teams to understand and solve complex data workflow problems, and provide technical support and solutions.
- Communication and documentation: regularly report to management on project progress, write technical documentation to ensure project transparency and maintainability.

Huawei's internal network data cockpit Dec 2021 - Dec 2022

Background development and maintenance

- Connect with the company's internal ES to obtain data and preprocess the data.
- Use the Mybatis framework to store preprocessed data in Mysql.
- The processed data is pushed into Kafka, and the big data module performs data processing.
- Use cache and Kafka to reduce the time of large batch data preprocessing from minutes to seconds.
- Continuously pay attention to the operation of the project and deal with the problems.
